PROFESSIONAL PROFILE

Second-year BSc Computer Science with Artificial Intelligence student at the University of York with hands-on project experience in machine learning, text-based recommendation, generative AI and web development. Built a lyrics-based music recommender using NLP preprocessing, TF-IDF vectorisation and cosine similarity; also explored content-based, user-based and item-based movie recommendation approaches. Independently trained and evaluated a GAN. Seeking a summer internship in software engineering, AI/ML, data or wider technology.

TECHNICAL SKILLS

Programming: Python, Java, JavaScript, C++

Machine learning & NLP: GANs, recommender systems, TF-IDF, cosine similarity, classification, model training and evaluation

Python libraries: Pandas, NumPy, scikit-learn, NLTK; TensorFlow and PyTorch (confirm which was used for GAN)

Web & app development: HTML, CSS, Streamlit; React and TypeScript explored in project work

Tools & data: Jupyter Notebook, Git/GitHub, SQL; Node.js, Express and SQLite explored in project work

SELECTED TECHNICAL PROJECTS

Tunely — Lyrics-Based Music Recommendation App | Python · Pandas · NLTK · scikit-learn · Streamlit

- Built a content-based music recommender using song lyrics, TF-IDF vectorisation and cosine similarity to rank tracks by lyrical similarity.
- Prepared a 5,000-song sample from a lyrics dataset; removed duplicate and missing records, filtered very short/long lyric outliers using the 10th and 90th percentiles, and normalised text.
- Applied NLTK tokenisation and Porter stemming before generating TF-IDF vectors and a cosine-similarity matrix.
- Built a Streamlit interface where users select a song, choose the number of recommendations and view suggested tracks and artists; added handling for songs not found in the selected dataset.

Movie Recommendation System | Python · Pandas · scikit-learn

- Implemented content-based recommendations using movie genres, TF-IDF vectorisation and cosine similarity to identify films with similar genre profiles.
- Built collaborative-filtering experiments using a user–movie ratings matrix, including user-based recommendations from similar users and item-based recommendations from similar movie-rating patterns.
- Explored a hybrid ranking approach that combines similarity with average ratings and rating counts; prepared movie and ratings data by handling missing values, duplicates and merging on movie ID.
- Experimented with a Decision Tree Regressor to predict movie ratings, using a train/test split and evaluating predictions with MAE, MSE and RMSE.

Generative Adversarial Network (GAN) | Generative AI / Machine Learning

Developed and trained a Generative Adversarial Network (GAN) using a publicly available dataset to explore synthetic image generation.

Explored generator and discriminator neural networks and the adversarial training process used to generate realistic synthetic data.

Preprocessed dataset inputs and monitored training behaviour to understand model performance and stability.

Evaluated model outputs and explored challenges associated with training generative deep-learning models.

AI-Powered Housing Platform | AI product concept · In development

- Developing a platform concept intended to help people find housing that better matches their needs.
- Framing housing discovery as a user-centred problem that could be supported by intelligent search or matching; implementation and AI matching features remain in development.

AI Financial Advisor | AI product concept · In development

- Planned an application concept for transaction categorisation, budgeting insights and a conversational assistant grounded in user-provided financial data.
- Explored an architecture combining a React/Vite/TypeScript frontend, Node/Express backend and SQLite storage.

Hot Beans Web | HTML · CSS · JavaScript · Tailwind CSS

- Created a multi-page website for a fictional web development company, including Home, Job Specifications, Apply, Resources, About and Meet the Team pages.
- Used HTML, CSS and JavaScript with Tailwind CSS for page layouts, styling and animation, considering accessibility and responsive presentation.

EXPERIENCE

Remote AI Task Contributor | Outlier and Mercor · Dates: Current

- Complete remote AI-related tasks through Outlier and Mercor.
- Follow task-specific instructions and apply attention to detail and consistent judgement; add exact task categories (such as response evaluation, prompt writing or coding review) once confirmed.

Student Ambassador | University of York · Dates: September 2025- To date

- Support university open days and speak with prospective students and visitors about studying Computer Science.
- Participate in project exhibitions and help communicate academic or technical work to different audiences.

Sales Assistant | Zara · September 2026 – Present

- Support customers and contribute to daily store operations in a fast-paced retail environment.
- Work collaboratively, communicate clearly and prioritise tasks to maintain a positive customer experience.

Sales Assistant | Pull & Bear · October 2024 – September 2026

- Worked across the shop floor, fitting room, self-checkout and tills, supporting customers throughout their visit.
- Supported stockroom operations and deliveries, helping organise stock and maintain shop-floor availability.
- Built transferable skills in teamwork, time management, adaptability and customer communication.

VOLUNTEERING

Volunteer | British Heart Foundation · summer 2024

- Add specific duties and dates before submission; include only activities personally carried out.

EDUCATION

University of York | BSc Computer Science with Artificial Intelligence · 2025–2028 expected

Second-year student. Modules completed:

- Software 1: Foundations of Programming for Computer Science
- Theory 1: Mathematical Foundations of Computer Science
- Human-Computer Interaction
- Software 2: Object Oriented Data Structures and Algorithms
- Systems and Devices 1: Introduction to Computer Architectures
- Theory 2: Formal Languages and Automata
- Engineering 1: Systems and Software Engineering
- Systems and Devices 2: Operating Systems, Security, and Networking
- Theory 3: Computability, Complexity and Logic
- Intelligent Systems: Machine Learning and Optimisation
- Data: Introduction to Data Science
- Systems and Devices 3: Advanced Computer Systems

Leigh Academy | Sixth Form · 2023–2025
